

Skin Cancer

While skin cancer is the most common form of cancer, many cases are easily preventable by limiting exposure to the sun's harmful rays and avoiding indoor tanning. Basal cell and squamous cell are the most common skin cancer types and are highly curable if caught early. Texas ranks third in the nation for newly diagnosed cases of melanoma, the deadliest form of skin cancer.

Statistics

- At least **20% of Americans** will develop skin cancer by the **age of 70**.
- In 2025, an estimated **5,700 melanoma cases** are expected to be diagnosed in Texas, with approximately **490 deaths**.
- Those who have used indoor tanning beds are **58% more likely** to be diagnosed with squamous cell carcinoma, and **24% more likely** to be diagnosed with basal cell carcinoma, than those who have not used indoor tanning beds.

Risk Factors

- **Ultraviolet (UV) Light Exposure:** Sunlight is the primary source of UV radiation.
- **Indoor Tanning:** Sun lamps and tanning beds emit UV radiation, which can cause skin damage and skin cancer.
- **Family History:** Those with a family history of melanoma have an increased risk for the disease.
- **Personal History:** Those with a personal history of skin cancer or sunburns, especially burns early in life; a high number of moles; skin that burns, freckles, or reddens with ease; or skin that is painful in the sun are at a higher risk.
- **Fair Skin:** People with fair skin are at a higher risk of developing skin cancer, especially those who also have freckles, blue or green eyes, and red, blonde, or light brown hair. However, everyone is at risk of developing skin cancer and should take precautions. In fact, though melanoma is less frequently diagnosed among people who are Black, Hispanic, or Asian, it is more often identified in later stages. Those at a higher risk for skin cancer should seek annual skin cancer screenings with a dermatologist.

Symptoms and Signs

The most common warning signs of skin cancer are new or unusual changes on the skin. It is important to have any changes to a mole or spot on the skin checked by a dermatologist. The ABCDE guide is a useful tool when checking your skin for melanoma warning signs.

- **A = Asymmetry:** One half of the lesion is different from the other in size, shape, or color.
- **B = Border:** The edge or border of the lesion is not smooth.
- **C = Color:** The color of the lesion contains various shades of tan, brown, black, and in some instances red, white, or blue.
- **D = Diameter or Dark:** A lesion that is darker than others, regardless of size. Skin cancer melanomas are usually 6 millimeters or larger in diameter, but they can be smaller.
- **E = Evolving:** The lesion changes over time or develops new symptoms, such as bleeding, crusting, or itching.

Tips for Prevention

- **Limit Exposure:** Avoid being outdoors in sunlight too long, particularly between the hours of 10 a.m. to 4 p.m., when UV light is strongest, and avoid indoor tanning.
- **Protect Your Skin:** Tightly woven, long-sleeved shirts and long pants or skirts are the most protective against UV

rays. Use a broad spectrum (protective against both UVA and UVB rays), water-resistant sunscreen with SPF 30 or higher on areas of skin exposed to the sun. Reapply every two hours or according to the product label. Water-resistant sunscreens need to be reapplied every 40 or 80 minutes, according to the product label. Use sunscreen even on days with light cloud cover, as UV light still permeates.

- **Wear a Hat:** A hat with a wide brim can help protect areas exposed to the sun's rays, such as the neck, ears, eyes, forehead, nose, and scalp. Straw hats may allow UV rays through, so choose a hat with a tight weave.
- **Wear Sunglasses:** Wrap-around sunglasses with UV absorption provide the best protection for the eyes and the skin around the eyes. Look for sunglasses labeled as blocking both UVA and UVB light.

Treatment Options

Basal cell and squamous cell cancers are most often cured by minor surgery or local treatments. The type of treatment depends on the size, location, and type of cancer. For certain squamous cell cancers with a high risk of spreading, surgery might be followed by radiation or chemotherapy. Immunotherapy and targeted therapy are also used to treat skin cancer.

About Texas Oncology

With more than 550 physicians and 300 locations, Texas Oncology is an independent private practice, a member of The US Oncology Network, that sees more than 71,000 new cancer patients each year. Founded in 1986, Texas Oncology provides comprehensive, multidisciplinary care, and includes Texas Breast Specialists, Texas Center for Proton Therapy, Texas Colon & Rectal Specialists, Texas Imaging & Infusion Center, Texas Oncology Surgical Specialists and Texas Urology Specialists. Texas Oncology's robust community-based clinical trials and research program has contributed to the development of more than 100 FDA-approved cancer therapies.
